FORT DOUGLAS, UTAH

REPORT
ON THE REMOVAL
OF UNDERGROUND STORAGE TANKS
AND
EXCAVATION OF CONTAMINATED SOILS
WITH
RESULTS OF SOIL SAMPLE ANALYSIS

WESTECH FUEL EQUIPMENT
DECEMBER, 1991

Between August 14 and September 20, 1991, ten Underground Storage Tanks (UST) were permanently closed by removal at Ft. Douglas, Utah (Figure 1). Two tanks were removed from a single excavation at Building 39 ("Fred's Head") and three tanks were removed from a single excavation at Building 216. Single tanks were removed from excavations at Buildings 122, 129, 134, 135 and 223. Light diesel contamination was found at Building 135. Waste oil contamination was found at Building 223 and diesel and gasoline contamination at Building 223. No contamination or other evidence of a release from the UST system was found at the other four sites. Around 2,500 cubic yards of both clean and contaminated soil were removed and disposed of in compliance with local and Utah State regulations. All fill material was removed and replaced with clean soil. No soils excavated at Fort Douglas were reused to fill any of the excavations.

All samples were analyzed at Utah Certified Laboratories using EPA Method 8015 Mod. for Total Petroleum Hydrocarbons (TPH) and benzene, toluene, xylene and ethylbenzene (BTEX) and EPA Method 413.1 or 418.1 for oil and grease. Unified Soil Classification (USC) was done using accepted manual test methods. Results of soil analysis are in Appendix A. Field measurements for contamination were done with a Foxboro 128GC Organic Vapor Analyzer (OVA).

A pre-closure site investigation was performed at Buildings 39, 122, 129, 134, and 216. This investigation was done by ICF Technology, Inc., 9300 Lee Highway, Fairfax, VA 22031. The assessment included soil gas surveys, soil borings and soil analysis, and installation of groundwater monitoring wells and groundwater analysis. This investigation is referred to several times and copies of appropriate maps and tables are in Appendix B.

Building 39

Also known as "Fred's Head", this building was formerly the service station for the Post Exchange system. This station was abandoned sometime prior to 1968, with the tanks left in place.

A 10,000 gallon and a 600 gallon UST were removed by Westech Fuel Equipment. The larger tank had been abandoned in place by filling it with water. The fill pipe was removed, but vent and product lines were left intact. The tank was still full of water when uncovered, and the water was analyzed, then

removed, treated, and disposed of by Advanced Petroleum Recycling. The tank was free of holes and corrosion. The product piping was pulled from beneath the adjacent concrete. The site map showed possible locations of two dispensers, but only one patch in the concrete was tentatively identified as a former dispenser location. Upon excavation, this patch proved to be from a recent sewer excavation.

ICF's Soil Gas Survey found indications of slight contamination beneath the concrete pad in the former dispenser area, but soil samples taken from borings found no contamination. Because the former locations of the dispensers could not be identified and because the soil samples from the pre-closure site assessment found no contamination beneath the concrete pad, no further attempt was made to obtain dispenser soil samples at this building.

The 600 gallon tank had been identified as a waste oil tank. It had no product piping attached when removed, but it did have a product pick-up line inside, so there is a possibility it was a small fuel tank. The fill pipe to this tank was open to the surface and the tank had several inches of water and debris when first checked. The water was analyzed and removed, treated and disposed of by Advanced Petroleum Recycling. At removal, the tank was opened and the interior was triple rinsed. The debris consisted mainly of rocks, but also included twigs, small objects and two baseball bats, evidently placed down the open fill pipe over the years. The tank was corroded and had several holes, but there was no evidence of soil contamination. Soil analysis confirmed there had been no product released.

All fill material from the original UST excavation was removed from this excavation, analyzed and disposed as clean fill at Salt Lake Valley Landfill.

Building 122

This is a small building behind (west) of Building 101. The UST, buried on the south side of the building, stored fuel for a generator located inside. The UST still contained one inch of gasoline when first checked. This fuel was removed and the tank was cleaned by Advanced Petroleum Recycling.

No holes or corrosion were found on the tank and soil analysis indicated no release. All fill material was removed from the excavation, analyzed, and disposed of as clean fill at Salt Lake Valley Landfill. The vent line was removed. The product line was cut where it entered the foundation of the building, four inches below the surface. The tank excavation

reached to within a foot of the foundation and no soil sample was taken for this product line.

ICF Technology's pre-closure site assessment found low level contamination SE and SW of the UST. No attempt was made to remove soil in these areas because of the low level of contamination and because the 300 amp main power supply to Building 101 is buried along the west and south sides of the UST excavation, separating these areas from the UST excavation.

Building 129

The UST adjacent to this building had been identified as a waste oil tank, but Dean Buchanan, manager of the USAR ECS #1 facility that uses this site, said it had been used for kerosene to fuel a heater in the building. It had been out of service since about 1965.

The top of the tank was buried under less than a foot of unpaved roadbase. The tank's top was corroded and at the east end there was a six inch diameter opening from the surface into the tank, where the metal and overlying dirt had collapsed into the tank. Because of surface drainage into this hole, the tank was about 3/4 full of dirt, and water filled the remaining space to the top.

Analysis of the water showed no contamination, and the water was removed and disposed of by Advanced Petroleum Recycling. Analysis of the fill material around the tank and of the debris from within the tank showed no contamination and both were disposed of at Salt Lake Valley Landfill as clean soil. Samples of the native soil also showed no contamination and no over-excavation was done.

The pre-closure site assessment by ICF Technology found areas of low level contamination nearby. The area around Building 129 is unpaved and used for both vehicle traffic and storage so low level contamination is not unexpected. This contamination does not seem related to the UST that was removed, the highest soil gas readings occurring 20-30 feet from the UST.

There was no product line attached to the UST at the time of removal, and the line was reported to have been aboveground when in use, so no dispenser or piping sample was taken.

Building 134

A 1,000 gallon waste oil UST was removed from the west side of this building, next to the fence. The surrounding surface was

paved, but the area over the tank was unpaved. There was visible contamination from spillage at the surface. This contamination reached down several feet at the north end. This tank had been emptied and taken out of use around 1986. When removed it was corroded and had several holes, although handling of the corroded tank during removal may have created at least some of these. Contamination was also found beneath the tank. Dean Buchanan, manager for this facility, said that another UST had been buried in the same location previously and it had been removed around 1969-1970 because it was leaking. No remediation had been done. Pre-closure site-assessment by ICF Technology involved several soil borings and installation of a groundwater monitoring well. Additional borings were done by Westech Fuel Equipment after closure to help determine the extent of contamination. Boring locations are with the sample results in Appendix A.

Over-excavation removed 406 cubic yards of contaminated soil, which was taken to the E.T. Technologies, Inc. soil reclamation facility at the Salt Lake Valley Landfill. Excavation and borings extended down to groundwater, 14-17 feet below the surface. Excavation was done on both sides of the fence. Confirmation soil samples from the excavation and soil samples from the borings indicate that over-excavation reached clean soil on the east, north and west sides. Contamination remains on the south side, where excavation was stopped because of trees, power poles, the fence and overhead and underground power lines. On the south side, analyses indicate TPH and BTEX levels are below Utah Recommended Clean-up Levels (RCL's) for Level I (most sensitive) sites, and Oil and Grease contamination is below Level II RCL's. The groundwater monitoring well installed by ICF remains in place if further analysis of groundwater is needed.

A four to six inch thick layer of black soil was seen at a depth of approximately six feet around the north end of the excavation. This was checked with an Organic Vapor Analyzer (OVA) and a sample was sent for analysis. It appears to be an old asphalt surface. The OVM detected nothing and analysis showed only very low Oil and Grease levels (Sample 8445-01).

Building 135

A 5,000 gallon diesel UST was in use at this building up to the time of its removal in September, 1991. The tank and lines were in excellent condition when removed, with no indications of soil contamination. Soil analysis, however, showed light diesel contamination beneath the tank and dispenser. The detected contamination was below Level I RCL's for diesel. Overfill and spillage are the suspected sources of the contam-

ination. This UST system was in an unpaved area.

Over-excavation removed 94 cubic yards of soil that was taken to the Salt Lake Valley Landfill where it was disposed of as clean fill because of the low level of diesel contamination. Soil was over-excavated from both the dispenser area and from beneath the tank. Confirmation samples were taken from the bottom of the UST excavation and they showed no remaining contamination. The dispenser area was no longer identifiable and was not resampled.

Building 216

This was the Post Exchange service station up to about 1984. Residual fuel and water were removed from the three UST's by Advanced Petroleum Recycling. The tanks were found to be in excellent condition, free of holes or corrosion. The product lines were pulled from beneath the concrete pad. There was no evidence of a release of fuel into the soil and analytical results confirmed there was no contamination at either the tanks or dispenser area. All fill material from the original excavation was removed and disposed of at Salt Lake Valley Landfill.

Building 223

The UST was located just southeast of Building 224, but the system was operated from Building 223, located approximately 200 feet to the northeast. An aboveground diesel tank stood at the west end of the UST and was removed just before excavation was done for the UST. The diesel dispenser was located at the southwest corner of Building 224.

Unleaded gasoline was dispensed from this UST system until it was removed in September, 1991. At the time of closure, the cover over the submersible pump was out of place and had been bent and forced down into the sub-pump access opening, possibly by a heavy vehicle driving over it. When the top of the tank was uncovered, contamination was found around the sub-pump and it appeared that pipe fittings had been loosened or broken when the lid was forced into the hole. Gasoline had been leaking from this part of the system every time gasoline was dispensed. Except for this problem, the rest of the UST system was free of corrosion, holes, or leaks.

Over-excavation was done to a depth of 26 feet before reaching a hard, red elastic silt layer that was not contaminated. The silt was overlain by a layer of boulders and coarse where contamination had spread west and south. Soil borings down to the coarse sand were used to determine the extent of

of contamination migration. Soil borings were also done on the west and south side of the aboveground diesel tank location. Soil analysis of samples from these borings indicated gasoline and diesel contamination under the former diesel tank location to a depth of 26', but it did not appear to have spread far laterally. Additional over-excavation was done to remove this contamination. A total of 520 cubic yards of contaminated soil was sent to E.T. Technologies, Inc. soil remediation facility at the Salt Lake Valley Landfill. Roughly 800 cubic yards of clean soil was removed to reach the contaminated soil. The clean soil was sent to the Salt Lake Valley Landfill and Northern Nevada Construction's commercial landfill.

There were no surface obstacles to excavation, and field checks with the OVM and confirmation samples indicate that no significant contamination was left at this site after over-excavation.

APPENDIX B
TRANSFORMER INFORMATION

March 25, 1991

R. L. STOLLAR & ASSOC.
303 E. 17th Ave. - Suite 550
Denver, CO 80203

Attention: Nan Glenn

Reference: Hevi-Duty/Dowzer New Transformers - PCB Content?

Dear Ms. Glenn:

In reference to your request for information as to PCB content of oil used in Hevi-Duty/Dowzer new distribution transformers, the following will help clarify any concern.

1. Hevi-Duty/Dowzer Electric has never manufactured transformers filled with PCB liquid. This eliminates any possibility of contamination in the plant's oil handling system.
2. Hevi-Duty/Dowzer has received written assurance from mineral oil suppliers that no PCB material is used in the processing of petroleum products nor does PCB occur naturally in petroleum. They have analyzed their oil and no PCBs were detected at the minimum detectable level.

Hevi-Duty/Dowzer Electric has also analyzed the new oil and confirmed that no PCBs exist at the minimum detectable level.

We feel the above explanation should relieve any concern as to the classification of Hevi-Duty/Dowzer new transformers as non-PCB when shipped.

For further information or additional questions please contact the Hevi-Duty/Dowzer office at the address or phone number listed below.

Yours truly,

HEVI-DUTY/DOWZER ELECTRIC

DOWZER TYPE CA TRANSFORMERS

Conventional style transformer with one set of mounting brackets, two high voltage bushings tank wall mounted. Designed, manufactured and tested in accordance with NEMA and ANSI specifications.

PATENTED* POWER CORE CONSTRUCTION
The low loss, low exciting current characteristics and quiet operation results from the patented POWER CORE. Made of high grade silicon steel, the core is assembled with a precise, distributed-gap technique providing the best magnetic qualities.

DURABLE WEATHER-TESTED FINISH
Tanks are primed with a rust inhibitor then coated with a pre-heated acrylic enamel. Less thinner is required resulting in a heavier finish.

ARC WELDED BRACKETS AND LIFTING LUGS
Designed with a built-in extra margin of safety, mounting brackets and lifting lugs are secured with a continuous arc weldment.

**MANUFACTURED UNDER RIGID
QUALITY CONTROL**
Transformers are 100% inspected through every phase of manufacturing. Up-to-the-minute test equipment assures reliability and product integrity.

Surge Arresters

**VarISTAR® Type AZS Distribution-Class
(IEC 5-kA Series B)
Certified Test Data**

R235-61-1

Reference Data

Design tests have been conducted on the McGraw-Edison VarISTAR Type AZS distribution-class arrester for overhead system application. They have been tested in accordance with the appropriate sections of the ANSI/IEEE Standard C62.1, IEC Publication 99-1, and CSA Standard 233 and has met the requirements of these standards. In addition, tests have been performed on the VarISTAR arrester not specified by ANSI, IEC or CSA standards but appropriate to metal-oxide varistor (MOV) surge arresters. The results of these standard tests are summarized in this text. Refer to Table 1 for the reference between required tests and specific paragraphs or clauses of the standard.

VOLTAGE-WITHSTAND TESTS OF ARRESTER INSULATION

The external insulation of VarISTAR Type AZS arresters has been tested in accordance with the standards. The withstand voltage of these arresters exceeds the values in these standards for all voltage ratings as shown in Table 2. Creepage and arcing distances are also listed.

DISCHARGE (RESIDUAL) VOLTAGE CHARACTERISTICS

The discharge (residual) voltage characteristics of the VarISTAR Type AZS are shown in Table 3 for various surge current magnitudes. These values are assured in production arresters by a discharge voltage test performed on every disk. Discharge voltage oscillograms are shown in Figures 1 through 5.

APPENDIX C
ASBESTOS ABATEMENT SUMMARY

AFZC-FE-ENR
31 Oct 91

INFORMATION PAPER

SUBJECT: Trip Report, Fort Douglas Asbestos Assessment

1. Purpose. To inform the DEH of the results of asbestos abatement at Fort Douglas, UT.

2. Point of major interest and facts.

a. 0700 - Friday - 11 Oct 91 - Arrived Ft Douglas, DEH, Bldg 232 with DEH's Help.

(1) Started scheduling quarters for site assessment.

(2) After site assessment team started scheduling work for Saturday, 12 Oct 91.

(3) Held Public Meeting, 1900, in post theater, Bldg 36, for residents for notification of assessment teams mission. Attendance was 12 people plus LTC Jensen and team members.

b. GENERAL

(1) SOP FOR ASSESSMENT TEAM -

(a) Assessment.

(b) Material set-up.

(c) Closed off area - suited up, moved misc. material, furniture, etc., and covered remaining area with visqueen (pastic sheets).

(d) Sprayed encapsulant on required areas.

(e) Wrapped with "Klote-Kwik" and tape as needed.

(f) Clean-up.

(g) Reinspected and posted ACM signs as needed.

c. Saturday, 12 Oct 91 - Started encapsulation as required.

List of occupied quarters accomplished:

1A, 1B, 2A, 2B, 3, 6A, 6B, 7B-Rewrapped by request (Visqueen), 8B, 9A, 9B, 10A, 11B, 14A, 14B, 15B-Wrapped (Visqueen), 16A, 16B, 17A, 17B, 18A, 18B, 18C, 20, 21, 22, 23, 55, 56B, 57A, 60B, 64A, 65A, 65B, 66A, 66B, 13A - Vacant, 13B - Vacant, 56A - Vacant

AFZC-FE-ENR

SUBJECT: Trip Report, Fort Douglas Asbestos Assessment

d. All air samples taken during site assessment were analyzed and were below clean air clearance levels of .01f/cc as per EPA recommendations for clearances of projects. Air sample results are on file in EENR asbestos file.

e. RECOMMENDATIONS: ACM in basements of all occupied quarters, basements has been repaired to minimize any exposure until other abatement can take place. This assessment team recommends basement areas in quarters not be used as living and/or storage areas do to the fact that asbestos located in these areas are so accessible for potential disturbance by various means.

Nick Pallotto/4828/2282

APPENDIX D
ANALYTICAL METHODS

D.1 ANALYTICAL METHODS

To provide a common point of reference for all projects and to provide a means of evaluating laboratory performance, USAEC prescribes the use of standardized methods for commonly encountered analytes. The standardized methods are based on published methods of analysis (e.g., by USEPA, American Society for Testing and Materials (ASTM), United States Geological Survey (USGS)) or past USAEC experience (e.g., for military-unique compounds). Methods have been evaluated in terms of sound analytical practice and applicability to projects. In addition to specifying sample preparation and analysis, each method also specifies calibration procedures and frequency, calibration check acceptance criteria, methods of preparing standard solutions, and preparation of QC samples. A description of any proposed deviations from the standardized methods must be submitted to USAEC prior to generation of the Precertification Performance Data Package. After certification of a method, additional deviations will not be acceptable, unless written approval, in advance, is provided by the USAEC Chemistry Branch. Changes made after certification may require generation of new Precertification and Certification Performance Data Packages.

Some methods, including calibration of test and measurement equipment, do not require certification, due to either the nature of the measurement or the intended used of the data. When such methods are part of the project, USAEC will not provide a standardized method. However, laboratories must submit sufficient information in Test Plans, Work Plans, Project QC Plans, etc. to describe exactly the procedures to be used.

The following methods performed for the EI program at Fort Douglas do not require certification by the USAEC Chemistry Branch:

- Lead Paint
- Total Petroleum Hydrocarbons (TPH)
- PCBs in oil

Certification may be required for these types of analyses if the resulting data serves as the basis for project decisions or regulatory compliance.

Any analytical method must be described by a set of written instructions completely defining the procedure to be used to process a sample and obtain an analytical result. Descriptions of analytes, sample type (matrix), sample preparation, types and quantities of reagents, instrumental calibration and measurements, and computations are all integral parts of a complete method.

Table D-1 lists the laboratory-specific USAEC approved analytical methods, USEPA equivalent methods, and reporting limits and the upper ranges for each type of certified analysis.

Table D-1

D.1.1 GC/MS VOLATILES

Water Method and Reference: The method of analysis for water is certified Method UM27, which is based on USEPA Method 8240 (SW-846 USEPA, 1986).

Water Method Summary: A 5-milliliter (mL) portion of the sample is spiked with internal standard and surrogate then transferred to the purging device. The sample is purged with helium and the analytes are trapped on a 3-phase sorbent tube. The analytes are desorbed at 185°C into a gas chromatograph/mass spectrometer with electron impact ionization and quadrupole detector.

Soil Method and Reference: The method of analysis for soil is certified Method LM28, which is based on USEPA Method 8240 (SW-846).

Soil Method Summary: An inert gas (helium) is bubbled through a 5-mL water and 5-gram soil sample (low level method) contained in a specifically designed purging chamber at ambient temperature. The purgeables are transferred from the soil/aqueous phase to the vapor phase and trapped on a three-phased sorbent column. The column is then heated to 180°C and the VOCs transferred onto a Megabore DB-624 column for temperature-programmed GC separation. Compounds from the GC column are detected and quantified by low-resolution mass spectroscopy. Quantitation is performed using internal standard techniques.

In addition, this method is applicable to the screening of VOCs which can be purged from soil and determined by thermal desorption GC/MS techniques. Compounds which can be determined by this method are nonpolar organic compounds having boiling points in the range of approximately 40° - 200°C.

D.1.2 GC/MS SEMIVOLATILES (BASE NEUTRAL ACIDS)

Water Method and Reference: The method of analysis for water is certified Method UM28, which is based on USEPA Method 8270 (SW-846).

Water Method Summary: An 1-liter portion of sample is spiked with surrogate compounds, and extracted with methylene chloride. The extract is dried with sodium sulfate and concentrated to 1 mL with a Kuderna-Danish apparatus. After the sample extract is screened by gas chromatography/flame ionization detector (GC/FID) it is injected with a gas chromatograph equipped with a mass spectrometer detector.

Soil Method and Reference: The method of analysis for soil is certified Method LM27, which is based on USEPA Methods 3540 and 8270.

Soil Method Summary: A 30-gram sample is mixed with sodium sulfate in a thimble. The thimble is spiked with surrogate spiking solution and extracted for 8 hours in a soxhlet apparatus. The solvent is

concentrated to 1.0 mL with a Kuderna-Danish apparatus. The sample extract is screened by GC/FID and injected into a gas chromatograph equipped with a mass spectrometer detector.

D.1.3 ICP METALS

Water Method and Reference: The method of analysis for water is certified Method SS14, which is based on USEPA Method 6010 (SW-846) and USEPA Method 200.7 (600/4-79-020, March 1983).

Water Method Summary: A 50-mL portion of the sample is heated in the presence of nitric and hydrochloric acids. The volume is reduced to 25 mL. The sample is cooled and diluted to 50 mL with ASTM Type I water. The resulting digest is analyzed using an Inductively Coupled Plasma (ICP) Spectrometer.

Soil Method and Reference: The methods of analysis for soil is certified method JS13 which is based on USEPA Methods 3050 and 6010 (SW-846).

Soil Method Summary: A 1-gram portion of the sample is heated in the presence of nitric acid and hydrogen peroxide. The sample is evaporated to near-dryness on a hot plate and refluxed with hydrochloric acid. The digest is analyzed using a sequential ICP. The ICP is integrated with a data system capable of controlling the instrument data acquisition function and processing the data acquired, including correcting for interelement interferences.

Lead Wipe Method and Reference: The method of analysis for wipe samples is Method AS01, which is based on USEPA Methods 3050 (Modified) and 6010 (SW-846).

Wipe Method Summary: The wipe sample is weighed and placed in a beaker with nitric acid. The sample is heated and refluxed with the nitric acid. The sample is then evaporated to near dryness and diluted to volume with deionized water. The resulting digest is analyzed using an ICP Spectrometer. Results are reported as total micrograms of lead per square centimeter.

D.1.4 GRAPHITE FURNACE ATOMIC ABSORPTION (GFAA)

D.1.4.1 Arsenic

Water Method and Reference: The method of analysis for water is certified Method SD30 which is based on USEPA Method 7060.

Water Method Summary: A 100-mL portion of the sample is heated in the presence of nitric acid and hydrogen peroxide. The solution is diluted to 100 mL with ASTM type I water. A portion of the resulting digest is mixed with a modifier solution (containing nickel nitrate) and analyzed using an atomic absorption spectrophotometer equipped with a graphite furnace.

Soil Method and Reference: The method of analysis for soil is certified Method JD19 which is based on USEPA Methods 3050 and 7060 (SW-846).

Soil Method Summary: A 1-gram portion of the sample is digested with nitric acid and hydrogen peroxide. The solution is diluted to 100 mL with ASTM type I water. A portion of the resulting digest is mixed with a modifier solution (containing nickel nitrate) and analyzed using an atomic absorption spectrophotometer equipped with a graphite furnace.

D.1.4.2 Lead

Water Method and Reference: The method of analysis for water is SD30 which is based on USEPA Method 7421.

Water Method Summary: A 100-mL portion of the sample is heated in the presence of nitric acid and hydrogen peroxide. The solution is filtered and diluted to 100 mL with ASTM type I water. A portion of the resulting digest is mixed with a modifier solution (containing magnesium nitrate and ammonium phosphate) and then analyzed using an atomic absorption spectrophotometer equipped with a graphite furnace.

Soil Method and Reference: The method of analysis for soil is certified Method JD17 which is based on USEPA Methods 3050 and 7421.

Soil Method Summary: A 1-gram portion of the sample is digested with nitric acid and hydrogen peroxide. The solution is diluted to 100 mL with ASTM type I water. A portion of the resulting digest is mixed with a modifier solution (continuing nickel nitrate) and analyzed using atomic absorption spectrophotometer equipped with a graphite furnace.

Paint Method and Reference: The analysis for paint utilizes atomic absorption techniques. The method, ASTM 3335-85A, is not a USAEC certified procedure.

D.1.4.3 Selenium

Water Method and Reference: The method of analysis for water is SD30 which is based on USEPA Method 7740.

Water Method Summary: A 100-mL portion of sample is heated in the presence of nitric acid and hydrogen peroxide. The solution is diluted to 100 mL with ASTM type I water. A portion of the resulting digest is mixed with a modifier solution (Magnesium nitrate and nickel nitrate) and analyzed using an atomic absorption spectrophotometer equipped with a graphite furnace.

Soil Method and Reference: The method of analysis for soil is JD15 which is based on USEPA Methods 3050 and 7740 (SW-846).

Soil Method Summary: A 1-gram portion of sample is heated in the presence of nitric acid and hydrogen peroxide. The solution is diluted to 100 mL with ASTM type I water. A portion of the resulting digest is mixed with a modifier solution (Magnesium nitrate and nickel nitrate) and analyzed using an atomic absorption spectrophotometer equipped with a Zeeman Furnace.

D.1.5 MERCURY

Water Method and Reference: The method of analysis for water is WW8 which is based on USEPA Method 245.1.

Water Method Summary: A 100-mL portion of sample is digested with a sulfuric/nitric acid-potassium permanganate solution by heating for 2 hours at 95°C. After reduction with hydroxylamine hydrochloride, stannous chloride is introduced into the vessel containing the digest and the vessel is attached to an atomic absorption spectrophotometer fitted for determination of mercury by cold vapor.

Soil Method and Reference: The method of analysis for soil is HG9 which is based on USEPA Method 7471 (SW-846).

Soil Method Summary: A 1-gram portion of sample is digested with aqua regia-potassium permanganate by heating at 95°C. After reduction with hydroxylamine hydrochloride, stannous chloride is introduced into the vessel containing the digest and the vessel is attached to an atomic absorption spectrophotometer fitted for determination of mercury by cold vapor.

D.1.6 POLYCHLORINATED BIPHENYLS (PCBs)

Water Method and Reference: The method of analysis for water is UHO2, which is based on USEPA Method 608.

Water Method Summary: An 800-mL sample is extracted with 3 x 50 mL of methylene chloride. The solvent is exchanged to hexane and concentrated to a final volume of 5 mL. The extracts are analyzed by gas chromatography/electron capture detector (GC/ECD) with helium as a carrier gas.

Oil Method and Reference: The method of analysis for transformer oil is not a USAEC certified procedure. The method is based on USEPA-600/4-81-045.

Oil Method Summary: The sample is diluted on a weight/volume basis so that the concentrations of each PCB isomer is within the capability of the GC system. The diluted sample is then injected into a gas chromatograph for separation of the PCB isomers.

D.1.7 TOTAL PETROLEUM HYDROCARBONS

Water Method and Reference: The method of analysis for water is based on USEPA Method 418.1 (USEPA, 1983).

Water Method Summary: An 800-mL sample is extracted with 3 X 30 mL of fluorocarbon-113 and brought to a final volume of 100 mL. Following the addition of silica gel, the extract is analyzed by infrared spectrophotometry.

Soil Method and Reference: The method of analysis for soil is based on USEPA Method 418.1, modified for the analysis of soil.

Soil Method Summary: A 10-gram sample is extracted with 3 X 30 mL of fluorocarbon-113 and brought to a final volume of 100 mL. Following the addition of silica gel, the extract is analyzed by infrared spectrophotometry.

D.1.8 CYANIDE

Water Method and Reference: The method of analysis for water is CN1 which is based on USEPA Method 9010.

Water Method Summary: The cyanide, as hydrocyanic acid (HCN), is released by refluxing 500 mLs of sample with strong acid and distillation of the HCN into an absorber-scrubber containing sodium hydroxide solution. The cyanide ion in the absorbing solution is then manually determined colorimetrically.

Soil Method and Reference: The method of analysis for soil is KY01 which is based on Contract Lab Program Modification (CLP-M) Method 335.2.

Soil Method Summary: A 15-gram sample is wetted with 500 mLs of water. Cyanide, as hydrocyanic acid (HCN), is released from cyanide complexes by means of a reflux-distillation operation and absorbed in a scrubber containing sodium hydroxide solution. The cyanide ion in the absorbing solution is then determined by volumetric titration or colorimetrically.

COMMENTS

SAMPLE INFORMATION

Sample ID Number(s) 65B-001

Type of Sample (circle one) WIPE PAINT CHIP

Area Wiped 100 cm² (wipe an area = 100 cm²)

Sample Location (also mark on floor plan) Door Trim

Film Roll/Picture Numbers None taken

Sample Date/Time 10-5-91, 104 1038

Sampler's Name TODD SULLIVAN

Analytical Results _____

PAINT/WIPE SAMPLE LOG AND ASSESSMENT FORM

Project: Fort Douglas

Building Number: 66B-001

Type of Building: Living Qtrs.

Age of Building: 1900 / 1933

SURVEY DATA

use the following ratings for 1A and 1B:

0 = no painted windows/woodwork

1 = all paint on windows/woodwork is intact

2 = some paint on windows/woodwork is peeling or broken

3 = large amounts of paint on windows/woodwork is peeling or broken

use the following ratings for 1C,D,E and 2A,B,C:

0 = no visible problems or defects

1 = a few problem areas, limited in size

2 = either many problem areas or several large problem areas

3 = problem areas are large and in many places

Rate the following:

1. Interior Condition

- | | | | | |
|----------------------------|-----------------------|---|----------------------------------|---|
| A. Painted windows | <input type="radio"/> | 1 | 2 | 3 |
| B. Painted woodwork | <input type="radio"/> | 1 | <input checked="" type="radio"/> | 3 |
| C. Peeling paint on walls | <input type="radio"/> | 1 | 2 | 3 |
| D. Broken plaster on walls | <input type="radio"/> | 1 | 2 | 3 |
| E. Water leaks | <input type="radio"/> | 1 | 2 | 3 |

2. Exterior Condition

- | | | | | |
|----------------------------|-----------------------|---|---|---|
| A. Peeling paint | <input type="radio"/> | 1 | 2 | 3 |
| B. Rotted, painted wood | <input type="radio"/> | 1 | 2 | 3 |
| C. Broken, painted masonry | <input type="radio"/> | 1 | 2 | 3 |

COMMENTS

Chipped area was small & all chips were removed for sample,
the chips also represented earlier layers of paint

SAMPLE INFORMATION

Sample ID Number(s) 66B-001

Type of Sample (circle one) WIPE PAINT CHIP

Area Wiped — cm² (wipe an area = 100 cm²)

Sample Location (also mark on floor plan) Entrance baseboard

Film Roll/Picture Numbers A, 15

Sample Date/Time 10-2-91, 0932

Sampler's Name TODD SULLIVAN

Analytical Results _____

PAINT/WIPE SAMPLE LOG AND ASSESSMENT FORM

Project: Fort Douglas

Building Number: 350

Type of Building: Swimming pool / locker/dressing rooms

Age of Building: 1937 / 36

SURVEY DATA

use the following ratings for 1A and 1B:

0 = no painted windows/woodwork

1 = all paint on windows/woodwork is intact

2 = some paint on windows/woodwork is peeling or broken

3 = large amounts of paint on windows/woodwork is peeling or broken

use the following ratings for 1C,D,E and 2A,B,C:

0 = no visible problems or defects

1 = a few problem areas, limited in size

2 = either many problem areas or several large problem areas

3 = problem areas are large and in many places

Rate the following:

1. Interior Condition

A. Painted windows	0	1	<u>2</u>	3
B. Painted woodwork	0	1	<u>2</u>	3
C. Peeling paint on walls	0	1	<u>2</u>	3
D. Broken plaster on walls	0	1	<u>2</u>	3
E. Water leaks	0	<u>1</u>	2	3

2. Exterior Condition

A. Peeling paint	0	1	2	3
B. Rotted, painted wood	0	1	2	3
C. Broken, painted masonry	0	1	2	3

COMMENTS

Sandstone bldg exterior trim & eaves are
in poor condition
NG-10/4/91

August 7, 1991

R.L. Stollar & Associates
Attn: Brian Myller
303 East 17th Street, Suite 550
Denver, Colorado 80203

Dear Brian Myller:

Please find enclosed hard copies of the analysis results for the water samples we received June 26, 1991. All of the results were generated using USATHAMA methods.

Should you have any questions or require additional information, please don't hesitate to call.

Sincerely,

Kevin McHugh
Laboratory Coordinator

G-7 Radon Data

RADON DATABASE CODES

1. FIELDS:

- a. BLDNUM: Building number (location)
- b. CAN ID: Radon Monitor serial number
- c. DEPL DAT: Deployment (Placement) date
- d. RETR DAT: Retrieval (Removal) date
- e. SB NUMB: Substitution Number; signifies the serial number of a radon monitor which was deployed in order to "substitute" or "replace" a monitor discovered missing at the time of retrieval.
- f. RN PCI L: The dose in picocuries/liter of the Radon monitor in CAN ID.
- g. TOHI: Too High; Yes or No as to whether the dose was 4.0 picocuries/liter or higher.
- h. QATP: QA Sample Type.
- i. DUPESER: Serial number of adjacently placed duplicate.
- j. BCAT: Building category code.
- k. FLNUM: Floor number
- l. ROOMNUMBR: Room Number and any further location ID or remarks.
- m. MTP: Monitor Type; whether A for ATM or C for charcoal.
- n. USID: User ID Codes (local)

2. Special Codes:

- a. RETR DAT code of 11/11/11 signifies a monitor discovered missing at the time of retrieval.
- b. TOHI: Y(es) or N(o); Code of "X" signifies monitors which were shipped to Terradex and were identified by Terradex as being damaged or having a processing irregularity.
- c. QATP:
 - S SPIKE
 - F FIELD BLANK
 - D DUPLICATE
 - R REPLACEMENT DEPLOYED FOR MISSING MONITOR
 - RD REPLACEMENT & DUPLICATE DEPLOYED FOR MISSING MONITOR & DUPLICATE
 - M MISSING MONITOR
 - DM MISSING MONITOR & DUPLICATE (In a few cases, the Duplicate of the missing monitor was not missing).
 - L LOST DURING PROCESSING; one of 18 monitors which were shipped to Terradex and were not included on any monitoring report (see attached memorandum for record).
- d. BCAT: The Building Category Code differs on the database from the Detector Deployment Data Sheets in order to achieve finer division of

specific areas:

- 03 WORKPLACE
- 04 OTHER
- 06 DINING FACILITY
- 07 FAMILY HOUSING
- 08 BILLETS
- 09 DAYCARE CENTER
- 10 SCHOOL
- 11 HOSPITAL
- 12 CLINICS (DENTAL, MEDICAL, AND VET)
- 13 BRANCH EXCHANGE (AAFES)
- 14 WAREHOUSE
- 15 SHOPS
- 16 FIRE STATION
- 17 GYM

Appendix H
Data Summary Tables for the Risk Assessment

Table H-1 Exposure Assessment Results for the Building 39 Area: Residential Scenario - Ingestion of Soil

CHEMICAL	Exposure Point Concentration (mg/kg)	Carcinogenic Average Daily Dose (mg/kg-d)	Noncarcinogenic Average Daily Dose (mg/kg-d)
Benzo(a)anthracene	0.039	6.1E-8	1.4E-7
Benzo(a)pyrene	0.052	8.1E-8	1.9E-7
Benzo(b)fluoranthene	0.046	7.2E-8	1.7E-7
Benzo(k)fluoranthene	0.072	1.1E-7	2.6E-7
Phenanthrene	0.037	5.8E-8	1.4E-7
Pyrene	0.081	1.3E-7	3.0E-7
Total Petroleum Hydrocarbons	40	6.3E-5	1.5E-4
Lead	60	9.4E-5	2.2E-4

Table H-2 Exposure Assessment Results for the Building 39 Area: Industrial Scenario - Ingestion of Soil

CHEMICAL	Exposure Point Concentration (mg/kg)	Carcinogenic Average Daily Dose (mg/kg-d)	Noncarcinogenic Average Daily Dose (mg/kg-d)
Benzo(a)anthracene	0.039	6.8E-9	1.9E-8
Benzo(a)pyrene	0.052	9.1E-9	2.5E-8
Benzo(b)fluoranthene	0.046	8.0E-9	2.3E-8
Benzo(k)fluoranthene	0.072	1.3E-8	3.5E-8
Phenanthrene	0.037	6.5E-9	1.8E-8
Pyrene	0.081	1.4E-8	4.0E-8
Total Petroleum Hydrocarbons	40	7.0E-6	2.0E-5
Lead	60	1.1E-5	2.9E-5

Table H-3 Exposure Assessment Results for the Building 39 Area: Recreational Scenario - Ingestion of Soil

CHEMICAL	Exposure Point Concentration (mg/kg)	Carcinogenic Average Daily Dose (mg/kg-d)	Noncarcinogenic Average Daily Dose (mg/kg-d)
Benzo(a)anthracene	0.039	9.1E-9	2.1E-8
Benzo(a)pyrene	0.052	1.2E-8	2.8E-8
Benzo(b)fluoranthene	0.046	1.1E-8	2.5E-8
Benzo(k)fluoranthene	0.072	1.7E-8	3.9E-8
Phenanthrene	0.037	8.6E-9	2.0E-8
Pyrene	0.081	1.9E-8	4.4E-8
Total Petroleum Hydrocarbons	40	9.3E-6	2.2E-5
Lead	60	1.4E-5	3.3E-5

Table H-4 Exposure Assessment Results for the Southeast Fence Line Area: Residential Scenario - Ingestion of Soil

CHEMICAL	Exposure Point Concentration (mg/kg)	Carcinogenic Average Daily Dose (mg/kg-d)	Noncarcinogenic Average Daily Dose (mg/kg-d)
Benzo(a)anthracene	0.072	1.1E-7	2.6E-7
Benzo(a)pyrene	0.068	1.1E-7	2.5E-7
Benzo(b)fluoranthene	0.086	1.4E-7	3.1E-7
Benzo(k)fluoranthene	0.058	9.1E-8	2.1E-7
Fluoranthene	0.14	2.2E-7	5.1E-7
Indeno[1,2,3(c,d)]pyrene	0.040	6.3E-8	1.5E-7
Methylnaphthalene ¹	0.094	1.5E-7	3.4E-7
Naphthalene	0.070	1.1E-7	2.6E-7
Phenanthrene	0.073	1.1E-7	2.7E-7
Pyrene	0.12	1.9E-7	4.4E-7
Total Petroleum Hydrocarbons	1,000	1.6E-3	3.7E-3
Lead	180	2.8E-4	6.6E-4

¹ = includes 1-methylnaphthalene and 2-methylnaphthalene

Table H-5 Exposure Assessment Results for the Southeast Fence Line Area: Industrial Scenario - Ingestion of Soil

CHEMICAL	Exposure Point Concentration (mg/kg)	Carcinogenic Average Daily Dose (mg/kg-d)	Noncarcinogenic Average Daily Dose (mg/kg-d)
Benzo(a)anthracene	0.072	1.3E-8	3.5E-8
Benzo(a)pyrene	0.068	1.2E-8	3.3E-8
Benzo(b)fluoranthene	0.086	1.5E-8	4.2E-8
Benzo(k)fluoranthene	0.058	1.0E-8	2.8E-8
Fluoranthene	0.14	2.5E-8	6.9E-8
Indeno[1,2,3(c,d)]pyrene	0.040	7.0E-9	2.0E-8
Methylnaphthalene ¹	0.094	1.6E-8	4.6E-8
Naphthalene	0.070	1.2E-8	3.4E-8
Phenanthrene	0.073	1.3E-8	3.6E-8
Pyrene	0.12	2.1E-8	5.9E-8
Total Petroleum Hydrocarbons	1,000	1.8E-4	4.9E-4
Lead	180	3.2E-5	8.8E-5

¹ = includes 1-methylnaphthalene and 2-methylnaphthalene

Table H-6 Exposure Assessment Results for the Southeast Fence Line Area: Recreational Scenario -
Ingestion of Soil

CHEMICAL	Exposure Point Concentration (mg/kg)	Carcinogenic Average Daily Dose (mg/kg-d)	Noncarcinogenic Average Daily Dose (mg/kg-d)
Benzo(a)anthracene	0.072	1.7E-8	3.9E-8
Benzo(a)pyrene	0.068	1.6E-8	3.7E-8
Benzo(b)fluoranthene	0.086	2.0E-8	4.7E-8
Benzo(k)fluoranthene	0.058	1.4E-8	3.2E-8
Fluoranthene	0.14	3.3E-8	7.6E-8
Indeno[1,2,3(c,d)]pyrene	0.040	9.3E-9	2.2E-8
Methylnaphthalene ¹	0.094	2.2E-8	5.1E-8
Naphthalene	0.070	1.6E-8	3.8E-8
Phenanthrene	0.073	1.7E-8	4.0E-8
Pyrene	0.12	2.8E-8	6.5E-8
Total Petroleum Hydrocarbons	1,000	2.3E-4	5.4E-4
Lead	180	4.2E-5	9.8E-5

¹ = includes 1-methylnaphthalene and 2-methylnaphthalene

Table H-7 Exposure Assessment Results for the Building 39 Area: Residential Scenario - Dermal Contact with Soil

CHEMICAL	Exposure Point Concentration (mg/kg)	Carcinogenic Average Daily Dose (mg/kg-d)	Noncarcinogenic Average Daily Dose (mg/kg-d)
Benzo(a)anthracene	0.039	3.2E-8	7.6E-8
Benzo(a)pyrene	0.052	4.3E-8	1.0E-7
Benzo(b)fluoranthene	0.046	3.8E-8	8.9E-8
Benzo(k)fluoranthene	0.072	6.0E-8	1.4E-7
Phenanthrene	0.037	3.1E-8	7.2E-8
Pyrene	0.081	6.7E-8	1.6E-7
Total Petroleum Hydrocarbons	40	NA	NA
Lead	60	NA	NA

NA = not applicable

Table H-8 Exposure Assessment Results for the Building 39 Area: Industrial Scenario - Dermal Contact with Soil

CHEMICAL	Exposure Point Concentration (mg/kg)	Carcinogenic Average Daily Dose (mg/kg-d)	Noncarcinogenic Average Daily Dose (mg/kg-d)
Benzo(a)anthracene	0.039	1.9E-8	5.2E-8
Benzo(a)pyrene	0.052	2.5E-8	6.9E-8
Benzo(b)fluoranthene	0.046	2.2E-8	6.1E-8
Benzo(k)fluoranthene	0.072	3.4E-8	9.6E-8

^a = Dermal Slope Factors are not available from USEPA but were derived for the purposes of this risk assessment. The dermal slope factors for the PAHs are based upon the oral slope factors, which were adjusted upward to account for an oral bioavailability of approximately 90 percent (Hecht et al., 1979).

Table H-30 Risk Characterization Results for the Southeast Fence Line Area: Recreational Scenario - Dermal Contact with Soil - Carcinogenic Risk

Chemical	Average Daily Dose (mg/kg-day)	Dermal Slope Factor ^a (mg/kg-day) ⁻¹	Cancer Risk
Benzo(a)anthracene	1.5E-8	1.2	1.8E-8
Benzo(a)pyrene	1.4E-8	8.1	1.1E-7
Benzo(b)fluoranthene	1.8E-8	1.1	2.0E-8
Benzo(k)fluoranthene	1.2E-8	0.57	6.8E-9
Fluoranthene	2.9E-8	NA	-
Indeno[1,2,3(C,D)] pyrene	8.3E-9	1.7	1.4E-8
